ABSTRACT

An air purifying device whose space for installation has an elongated shape, air to which is supplied through a duct or a tube, and which can uniformly cause the air to exit the surrounding space. It comprises a hollow cylindrical filter (3) made by forming a filter media (1) in a cylindrical shape having an air passage (2) in the central hollow portion, and a pair of air intake members (6) made of a hollow cylindrical body that has a closed bottom (4) having an air intake hole (5) tightly fixed with sealing material on both ends of the hollow cylindrical filter so that the hole communicates with the air passage.

(54) Title: AIR-PURIFYING DEVICE

(54) 発明の名称: 空気清浄装置

(57) Abstract: An air-purifying device whose installation place has an elongate shape, air to which is supplied through a duct or a tube, and which can jet uniform purified air to the surrounding space of the installation place. A hollow-cylindrical filter (3) is constructed by providing a circular air passage (2) penetrating through the center of a filter material (1) formed in a hollow-cylindrical shape. Air inlet members (6) each formed by providing an air supply hole (5), communicating with the air passage (2), in a peripheral wall of a follow-cylindrical body (4) having the bottom are fitted and tightly fixed by a sealing member on an upper and a lower portion of the hollow-cylindrical filter (3), and thus an air-purifying device is obtained.
